

Report 6: Overnight MT5 Forward Test And Price Feed Mismatch

Report date: 2026-06-03
Market: Gold
Analysis symbol used during run: GC=F
Broker execution symbol: XAUUSD.vx
Run directory: C:\Users\Administrator\.tradingagents\sessions\2026-06-02-overnight-b-plus
Run type: MT5 forward test with deterministic engine decisions and B+ enabled
Run window observed in logs: 2026-06-02 15:04 to 23:13 New York time

1. Executive Summary

The overnight forward test was successful as a systems test, but it was not a valid execution-quality test because the analysis price feed and broker execution price feed were not the same instrument.

The bot ran, generated fresh telemetry, detected tradeable A+ setups, built MT5 requests, placed three pending orders, monitored them, and cancelled them after the activation window expired. There were no broker rejections and the account ended flat with no open orders or positions.

The reason the trades did not fill is now clear: the engine calculated Gold entries from Yahoo GC=F, then sent those raw prices to MT5 for XAUUSD.vx. At the moments of order placement, the proposed entries were about 24 to 41 points away from the live MT5 quote. With a 10-minute activation window, those orders were very unlikely to trigger.

This means the main bug is not MT5 connectivity, not auto-trading permission, and not the order type logic. The main bug is the live execution data basis.

2. Run Results

Metric	Result
Real runner checks	93
NO_TRADE decisions	30
ORDER_PLACED events	3
ACTIVE_TRADE_MONITORED events	60
Broker rejections	0
Broker skipped executions	0
Open orders after stop	0
Open positions after stop	0
Healthy fresh checks	31
Unhealthy fresh checks	2

The bot did more than idle. It made decisions, submitted orders, and monitored the broker. The missing fill is explained by the distance between GC=F-based levels and the live XAUUSD.vx market.

3. Orders Placed

| New York time | Side | Setup | Grade | Entry | Stop | Target | MT5 type | Order | Outcome |
| 2026-06-02 19:15 | SELL | Breakout | A_PLUS | 4517.4708 | 4517.9101 | 4516.1529 | SELL_LIMIT
| 77700611 | Accepted, then cancelled after activation window |

| 2026-06-02 22:15 | SELL | Breakout | A_PLUS | 4503.7660 | 4504.4748 | 4501.6396 | SELL_LIMIT
| 77949137 | Accepted, then cancelled after activation window |
| 2026-06-02 22:45 | BUY | Support/Resistance Bounce | A_PLUS | 4503.2716 | 4502.4652 |
4505.6908 | BUY_STOP | 77987318 | Accepted, then cancelled after activation window |

All three orders were valid enough for MT5 to accept. None became live positions.

4. Why The Trades Did Not Fill

At placement time, the live MT5 quote for XAUUSD.vx was far below the engine's proposed entry price. The gap was too large for a short activation window.

New York time	Order type	Engine entry	MT5 quote at placement	Approximate distance
2026-06-02 19:15	SELL_LIMIT	4517.47	4476.39 / 4476.72	+41 points
2026-06-02 22:15	SELL_LIMIT	4503.77	4479.57 / 4479.86	+24 points
2026-06-02 22:45	BUY_STOP	4503.27	4477.09 / 4477.38	+26 points

For a pending order to fill, market price must trade into the pending entry. These entries were not sitting near the broker's live Gold price. They were levels from a different price feed.

The 10-minute cancellation behavior worked as intended. It removed stale pending orders instead of leaving old orders in the market overnight.

5. Root Cause

The live runner was configured with:

Setting	Value
TRADINGAGENTS_ANALYSIS_SYMBOL	GC=F
TRADINGAGENTS_BROKER_SYMBOL	XAUUSD.vx
TRADINGAGENTS_MT5_SYMBOL	XAUUSD.vx

The deterministic engine fetched candle data for GC=F, then built exact entry, stop, and target prices from that feed. The MT5 execution path then used those exact levels on XAUUSD.vx.

That is unsafe for live execution because futures-like Yahoo Gold pricing and the broker CFD symbol are not guaranteed to match point-for-point. The test proved they were not matching during this run.

6. B+ Review

B+ grading was enabled during the run, but it did not affect execution.

Grade	Filled candidates	Placed orders
A_PLUS	3	3
B_PLUS	0	0

This is useful evidence. The B+ code path did not create low-quality trades overnight. The three orders came from A+ candidates, but they still failed to fill because the price basis was wrong.

7. What Worked

The following parts of the system behaved correctly:

- Fresh telemetry session isolation worked.
- Duplicate processed-candle checks no longer inflated the summary.
- MT5 connection and account verification worked.
- The broker accepted pending orders.
- Active trade monitoring worked.
- Stale pending order cancellation worked.
- B+ grading did not accidentally overtrade.

This means the execution framework is close. The next blocker is feeding the engine with the same price source used for execution.

8. What Must Change Before The Next Overnight Run

The live MT5 runner should stop using GC=F as the execution analysis feed.

The safer design is:

1. Fetch XAUUSD.vx candles directly from MT5.
2. Build the same 15m, 30m, 1h, 4h, and daily snapshot the deterministic engine already expects.
3. Run the same engine against that MT5 snapshot.
4. Place orders only when the proposed entry is near the current MT5 bid/ask.
5. Keep GC=F only for non-execution reports or separate comparison research.

The order type logic does not need to be the first fix. It already selected stop or limit pending orders based on the live quote. The bigger issue is that the entry price itself came from the wrong market.

9. Recommended Next Test

After implementing the MT5-native data feed:

1. Run broker-probe and confirm the account, server, and XAUUSD.vx quote.
2. Run one engine cycle only.
3. Confirm the engine payload says the data source is MT5.
4. Confirm proposal symbol, broker_symbol, and MT5 symbol all point to XAUUSD.vx.
5. Confirm proposed entry is within the configured maximum distance from MT5 bid/ask.
6. Start a new fresh telemetry directory for the next overnight session.

10. Conclusion

The bot did not fail because it could not trade. It failed to fill because it traded levels calculated from GC=F while executing on XAUUSD.vx.

The next serious overnight test should not begin until the engine is fed by MT5 candles for XAUUSD.vx and the executor has a price-distance guard that blocks proposals too far from the broker quote.
